

# PALATIUM CARE®

Wireless Nurse Call System

## SpectraLink Interface

PalatiumCare SpectraLink Interface (SLI) extends the functionality of current SpectraLink Cordless phones. The solution seamlessly incorporates with new and existing data paging systems. By allowing e-call messages to be received by one or more cordless phones, PalatiumCare SLI turns a cordless phone into a powerful voice and data communication device.

PalatiumCare combines two industry standard tools into one. With the inclusion of field programmable settings, changes can be made without any special software or service calls. Auto archiving, which allows the system to self-manage old messages, prevents end users from getting tied down by tedious message management. PalatiumCare SLI allows care givers to spend more time with their residents and less time with technology.
